

Energy and environmental guidelines

By introducing and maintaining an environmental and energy management system our intention is to be aware of the resource consumption of Pilz GmbH & Co.KG at its Ostfildern site and of the associated impact on the environment, in order to eliminate unnecessary consumption.

We are committed to continuous **improvement** of our **energy and environmental performance** in order to **protect the environment**.

We want to achieve this by:

- The development of environmentally friendly products using ecological materials and energy-saving techniques
- The provision of necessary resources and information to achieve our strategic and operational goals
- Careful use of water, energy, hazardous substances and other resources
- Use of renewable energies
- We avoid or minimize environmental impacts such as waste through recycling and reuse of materials, waste water, GHG emissions and noise.
- Involving our employees through idea management and regular training courses
- Recording and assessing the effects of our activities on the environment, deriving them into goals and measures for improvement in our management system. We are committed to working continuously to reduce our environmental impact.
- Procuring energy-efficient and environmentally friendly products and services where possible.
- Communication with our suppliers

In all our activities it goes without saying that we meet and regularly review our binding commitments.

Every member of staff should be aware of the impact their activities have on the environment and so on our life force and use resources responsibly. **It is the duty of each member of staff to protect the environment and use energy efficiently.**

Susanne Kunschert
